

Basketball Ops Intern Project

We would like you to build an application that exposes and visualizes the attached data. Your application can be deployed in whatever manner you think is best and should be easy for a non-technical audience to access. **To submit, please email all project files in a zip folder to everyone included on this email.**

1) Included in this email are three CSVs:

a) tracking.csv

- i) This file contains data on workload for multiple players throughout the year
- ii) High_Accel and High_Decel columns represent the total of each high-intensity event for a date while the Distance column holds the total miles traveled
- iii) High_Accel and High_Decel events should just be interpreted as events occurring during a game or practice that contribute to a higher workload

b) force_plate.csv

- i) This file contains data on Forceplate jumps for multiple players throughout the year
- ii) The jumps are split by leg
- iii) Peak_Eccentric_Force and Peak_Concentric_Force are measured in newtons and Jump_Height is measured in inches

c) schedule.csv

- i) This file contains data on what type of activity the players were engaging in on each date (Game or Practice)
- ii) This data is the same for all players

2) Application Requirements

- a) Display each player's performance data in a visually-appealing, organized application
 - i) The intended audience of the page should be Medical and Performance practitioners (physical therapists, trainers, strength coaches, etc..)
 - ii) There should be an intuitive way to navigate between players (assume these are all Grizzlies players)
- b) Include visuals, modules, and features that you think give the data useful context and make the data actionable
 - i) Visualize the data in ways that you think are intuitive and powerful
 - ii) Be creative and put thought into the design of the site, not just the implementation
- c) Include functionality to let the user view a player's data aggregated by week and month in addition to day
 - i) It is up to you on how you want to incorporate this, but assume the stakeholders will want to zoom out from just viewing data on a daily level
- d) Do NOT use R or RShiny to build your application
 - i) Any Python frameworks or libraries are fair game
 - ii) Any JavaScript/HTML frameworks or libraries are fair game
- e) There may be missing data in some scenarios – your site should be able to handle these instances without breaking
- f) Do NOT use AI Agentic Coding
 - i) Using AI for code completion, to look up syntax, or for other general assistance is permitted
 - ii) Do not create your project via prompting an AI tool
 - (1) In interview steps following the project, your understanding of the code you've submitted will be tested
